## Pin Assignment

## Pin function

Pin No.	Pin name	Pin function	Equivalent Circuit
1	V <sub>CC</sub>	Power-supply voltage pin. V <sub>CC</sub> voltage is impressed. The permissible operation voltage is from 4.0 to 16.0(V). The capacitor is connected for stabilization for GND pin (6pin).	
2	IN1	Motor drive control input pin. Driving control input pin of OUT1 (10pin) and OUT2 (9pin). It is used in combination with IN2 pin (3pin). For the digital input, range of the "L" level is 0 to 0.7(V), range of the "H" level is from 1.8 to 5.5(V). PWM can be input. Pull-down resistance 100(kΩ) is built into in the pin. It becomes a standby mode because all IN1, IN2, IN3, and IN4 pins are made "L", and the circuit current can be adjusted to 0.	
3	IN2	Motor drive control input pin. Driving control input pin of OUT1 (10pin) and OUT2 (9pin). It is used in combination with IN1 pin (2pin). PWM can be input. With built-in pull-down resistance.	
4	IN3	Motor drive control input pin. Driving control input pin of OUT3 (8pin) and OUT4 (7pin). It is used in combination with IN4 pin (5pin). PWM can be input. With built-in pull-down resistance.	
5	IN4	Motor drive control input pin. Driving control input pin of OUT3 (8pin) and OUT4 (7pin). It is used in combination with IN3 pin (4pin). PWM can be input. With built-in pull-down resistance.	
6	GND	Ground pin.	
7	OUT4	Driving output pin. The motor coil is connected between terminal OUT3 (8pin).	
8	OUT3	Driving output pin. The motor coil is connected between terminal OUT4 (7pin).	
9	OUT2	Driving output pin. The motor coil is connected between terminal OUT1 (10pin).	
10	OUT1	Driving output pin. The motor coil is connected between terminal OUT2 (9pin).	

## Operation explanation

L	L			OFF	OFF			1CH	
H	L			H	L				Forward
L	H			L	H				Reverse
H	H			L	L				Brake
		L	L			OFF	OFF	2CH	
		H	L			H	L		Forward

		H	H			L	L		Brake

## 2. About the switch time from the stand-by state to the state of operation

When IN1, IN2, IN3, IN4 are "L", this IC has completely stopped operating. After the time of reset of about 7 $\mu$ s of an internal setting, it shifts to a prescribed output status corresponding to the state of the input when the signal enters the input terminal.

Reset of about 7 $\mu$ s doesn't hang even if the motor is driven from the stand-by state when either CH drives and the output becomes an output status corresponding to the state of the input. As for full power TR between the reset time, turning off is maintained.

## 3. Example of current wave type in each excitation mode when stepper motor parallel input is controlled.

### • Full-step mode

### • Half-step mode

## 4. Thermal shutdown function

The thermal shutdown circuit is incorporated and the output is turned off when junction temperature  $T_j$  exceeds 180 $^{\circ}$ C. As the temperature falls by hysteresis, the output turned on again (automatic restoration).

The thermal shutdown circuit does not guarantee the protection of the final product because it operates when the temperature exceed the junction temperature of  $T_{jmax}=150^{\circ}$ C.

$TSD = 180^{\circ}$ C (typ)

$\Delta TSD = 40^{\circ}$ C (typ)

## Application Circuit Example

1. Example of applied circuit when two DC motor driving

2. Example of applied circuit when one stepper motor driving

3. Example of applied circuit when connecting it in parallel

The use likened to H bridge 1ch is shown possible in the figure below by connecting IN1 with IN3, IN2 with IN4, OUT1 with OUT3, OUT2, and OUT4. ( $I_O \text{ max}=2.0\text{A}$ , Upper and lower total  $R_{ON}=0.5\Omega$ )

\* Bypass capacitor (C1) connected between VCC-GND of all examples of applied circuit recommends the electric field capacitor of  $0.1\mu\text{A}$  to  $10\mu\text{A}$ .

Confirm there is no problem in operation in the state of the motor load including the temperature property about the value of the capacitor.

Mount the position where the capacitor is mounted on nearest IC.
